

## National and State Grand Champion Winners

From the time our seedlings are put in the ground, a complete program of maintenance is followed to produce healthy trees. This includes fertilization, ...grass, weed and insect controls ...disease prevention.

All of our trees are plantation grown and individually sheared many times before they are harvested.

Experienced taggers selectively choose the trees to be cut, grading them as No. 1 and premium.

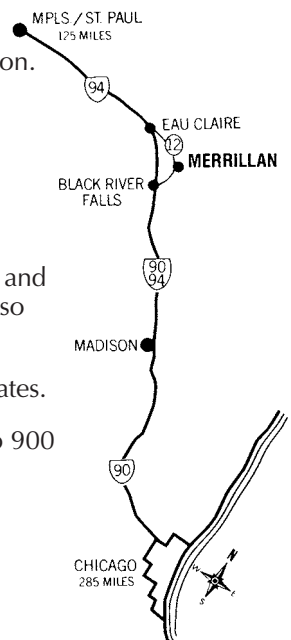

Our Christmas Trees are cut as close to the shipping time as possible and baled individually. They are immediately loaded out of the field and stored in Pine shaded areas to insure that you get Fresh Trees. Your Sales personnel should be taught to instruct the retail buyer the importance of making a new cut and immediately inserting their tree in water and never allowing it to dry out. As fresh flowers need water so do fresh cut trees.

Trees may be picked up with your own trucks or we can make arrangements for delivery. Call us for rates.

Quantity per load for cut trees will vary with types and sizes, but the average load will be from 700 to 900 trees on a 48 foot flat bed.

Stop in and visit any time...our trees are our best advertisement.
